The goal of this course is to introduce and demonstrate how an economist derives an empirical model from a theoretical model, and then estimates the empirical models by using softwares on economic data. It will demonstrate how the basic applied econometric methods, including multiple regression, MLE, quantile regression and semi-parametric method, are applied to the analysis of real economic data. It will also demonstrate how to test the hypothesis coming from the economic theory. Furthermore, it will introduce the ARCH models focusing on specific forms of financial data and panel data models.
